SELECTION OF A BEST SPEECH RECONIZER FROM MULTIPLE SPEECH RECOGNIZERS USING PERFORMANCE PREDICTION

ABSTRACT

A method for selecting a speech recognizer from a number of speech recognizers in a speech recognition system. The speech recognition system receives an audio stream from an application and derives enabling information. The speech recognition system then enables at least some of the speech recognizers and receives their results. It derives selection information and uses it to select the best speech recognizer and its results and returns those results back to the application.
